

**Canada Nickel Announces Improvements  
to Accelerated CO<sub>2</sub> Capture Process**

**Highlights**

- *Recent test work accelerates carbon capture by three times and achieves majority of carbon capture in just 24 hours*
- *Simple carbon capture approach could allow production of Net Zero Nickel and generation of 21 tonnes of CO<sub>2</sub> credits per tonne of nickel*
- *Crawford Project could produce an estimated average of 710,000 tonnes of CO<sub>2</sub> credits annually and 18 million total tonnes of CO<sub>2</sub> credits over expected life of mine*

TORONTO, November 8, 2022 – Canada Nickel Company Inc. ("Canada Nickel" or the "Company") (TSXV:CNC) (OTCQX:CNIKF) today announced the results of further laboratory test results that build on the success of initial work on the In Process Tailings ("IPT") Carbonation Process, which is a novel method for accelerated carbon capture that the Company believes has transformative potential.

Mark Selby, Chair and CEO of Canada Nickel commented, "These lab scale tests advance our understanding of how to operationalize this process to turn a nickel mine into a net generator of carbon credits rather than a generator of carbon emissions. In our latest testing, we were able to triple the amount of carbon captured in 24 hours versus our prior test work. Our goal is to develop a process which would utilize existing plant equipment and processes to operationalize our IPT Carbonation process, which is at least 8-12 times faster than current passive approaches and what industry leaders are currently able to achieve, with easier quantification and verification of the amount of carbon captured."

**Figure 1. Improved CO<sub>2</sub> Capture using new process levers**

This new set of results from the lab scale test program completed at Kingston Process Metallurgy (“KPM”), utilizing the most reactive tailings stream, demonstrates that changes to two key levers increased the amount of carbon capture in just 24 hours relative to the previous tests by more than three times, and achieved more than 60% of the previously achieved carbon capture level that had taken six days. Understanding the impact of these variables on the carbon capture potential is believed to be key to operationalizing the process.

### **IPT Carbonation process**

Canada Nickel’s Crawford Project is hosted in ultramafic rock, which naturally absorbs and sequesters CO<sub>2</sub>. The potential to actively capture and sequester carbon was a key consideration in Canada Nickel’s acquisition of the 42 km<sup>2</sup> of target ultramafic rocks in Timmins area which could anchor a zero-carbon industrial cluster in Timmins. The challenge has been to develop a process that speeds up the naturally occurring carbon absorption process. Canada Nickel has developed a simple active process that utilizes tailings as generated in the milling process and injects a concentrated source of CO<sub>2</sub> for a brief period of time. This novel process for accelerated mineral carbonation is called In Process Tailings Carbonation or IPT Carbonation, which fixes CO<sub>2</sub> geologically while the tailings are still in the processing circuit, rather than after they have been finally deposited.

While Canada Nickel’s IPT Carbonation process has only been demonstrated at the lab scale and on a limited number of samples, the Company believes that, given its relative simplicity, this process could be scaled up with availability of concentrated (rather than atmospheric) sources of CO<sub>2</sub>. This CO<sub>2</sub> could potentially be delivered by downstream processing of Crawford concentrates, a wide range of industrial processing activities, green hydrogen production, carbon capture facilities, or natural gas power generation. The process clearly demonstrates the potential to produce NetZero Nickel™ and NetZero Cobalt™ for the EV industry, NetZero Iron™ and chromium for the stainless steel industry and generate substantial carbon credits during the process. The Company believes that the need for a concentrated source of CO<sub>2</sub> for this process and the substantial CO<sub>2</sub> capture capacity potential of its ultramafic land position could form the basis for an entire zero carbon industrial cluster in the Timmins region.

The IPT Carbonation process utilizes tailings directly from the mineral processing circuit and conditions them with CO<sub>2</sub> for a brief period of time. After this conditioning, the tailings achieved the Net Zero carbon capture target in less than 36 hours and achieved gross carbon capture rates of at least 26 tonnes of CO<sub>2</sub> / tonne of nickel (5 times the amount necessary to achieve Net Zero metal production) in just six days and could produce an estimated average of 710,000 tonnes of CO<sub>2</sub> credits annually and 18 million total tonnes of CO<sub>2</sub> credits over expected life of mine based on the Crawford preliminary economic assessment (“PEA”) (see news release dated May 25, 2021). The experimental method and results for IPT Carbonation were initially completed at XPS, Expert Process Solutions, a Glencore Company, and the mechanism was then reproduced at a second independent lab, Kingston Process Metallurgy, adding confidence to the process. No further information is being provided on the method at this time and work is underway to test a wide range of variables to optimize the process.

IPT Carbonation, which is an active process, has benefits over passive mineral carbon capture as the method for quantifying and verifying CO<sub>2</sub> capture is expected to be much simpler. Using a standard carbon balance in the mineral processing facility, the CO<sub>2</sub> captured from IPT Carbonation can be quantified before tailings are discharged into the permanent tailings storage facility such that carbon offsets can be

quantified in real time as part of a standard metallurgical accounting system. Canada Nickel expects industry standards to be developed for quantifying CO<sub>2</sub> capture through passive methods as well.

#### **Qualified Person and Data Verification**

Arthur G. Stokreef, P.Eng (ON), Manager of Process Engineering & Geometallurgy and a “qualified person” as such term is defined by National Instrument 43-101, has reviewed and approved the technical information in this news release on behalf of Canada Nickel Company Inc.

#### **About Canada Nickel**

Canada Nickel Company Inc. is advancing the next generation of nickel-sulphide projects to deliver nickel required to feed the high growth electric vehicle and stainless steel markets. Canada Nickel Company has applied in multiple jurisdictions to trademark the terms NetZero Nickel™, NetZero Cobalt™ and NetZero Iron™ and is pursuing the development of processes to allow the production of net zero carbon nickel, cobalt, and iron products. Canada Nickel provides investors with leverage to nickel in low political risk jurisdictions. Canada Nickel is currently anchored by its 100% owned flagship Crawford Nickel-Cobalt Sulphide Project in the heart of the prolific Timmins-Cochrane mining camp. #### **Cautionary Note and Statement Concerning Forward Looking Statements**

This press release contains certain information that may constitute "forward-looking information" under applicable Canadian securities legislation. Forward looking information includes, but is not limited to, the carbon capture approach could allow production of Net Zero nickel and generation of an additional tonnes of CO<sub>2</sub> credits per tonne of nickel produced after offsetting all emissions, the potential to turn nickel mine into a generator of carbon credits rather than generator of carbon emissions, the production of estimated average of 710,000 tonnes of carbon credits annually and 18 million total tonnes of CO<sub>2</sub> of credits over expected life of mine at Crawford, the ability to monetize carbon credits, the ability to quantify carbon capture, emission estimates, the brucite content of the deposit, the scalability of the process, the metallurgical results, the timing and results of the feasibility study, the results of Crawford's PEA, including statements relating to net present value, future production, estimates of cash cost, proposed mining plans and methods, mine life estimates, cash flow forecasts, metal recoveries, estimates of capital and operating costs, timing for permitting and environmental assessments, realization of mineral resource estimates, capital and operating cost estimates, project and life of mine estimates, ability to obtain permitting by the time targeted, size and ranking of project upon achieving production, economic return estimates, the timing and amount of estimated future production and capital, operating and exploration expenditures and potential upside and alternatives. Readers should not place undue reliance on forward-looking statements.

Forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause the actual results, performance or achievements of Canada Nickel to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. The PEA results are estimates only and are based on a number of assumptions, any of which, if incorrect, could materially change the projected outcome. There are no assurances that Crawford will be placed into production. Factors that could affect the outcome include, among others: the actual results of development activities; project delays; inability to raise the funds necessary to complete development; general business, economic, competitive, political and social uncertainties; future prices of metals or project costs could differ substantially and make any commercialization uneconomic; availability of alternative nickel sources or substitutes; actual nickel recovery; conclusions of economic evaluations; changes in project parameters as plans continue to be refined; accidents, labour disputes, the availability and productivity of skilled labour and other risks of the mining industry; political instability, terrorism, insurrection or war; delays in obtaining governmental approvals, necessary permitting or in the completion of development or construction activities; mineral resource estimates relating to Crawford could prove to be inaccurate for any reason whatsoever; additional but currently unforeseen work may be required to advance to the feasibility stage; and even if Crawford goes into production, there is no assurance that operations will be profitable.

Although Canada Nickel has attempted to identify important factors that could cause actual actions, events or results to differ materially from those described in forward-looking statements, there may be other factors that cause actions, events or results to differ from those anticipated, estimated or intended. Forward-looking statements contained herein are made as of the date of this news release and Canada Nickel disclaims any obligation to update any forward-looking statements, whether as a result of new information, future events or results or otherwise, except as required by applicable securities laws.
